

NAME

ovp2ovf – convert a virtual property-list file into a virtual font file and its associated font metric file

SYNOPSIS

ovp2ovf [*OPTION*...] *OVPPFILE* [.ovp] [[*OVFFILE* [.ovf]] [*OFMFILE* [.ofm]]]

DESCRIPTION

ovp2ovf translates a human-readable virtual property list (OVP) file, *OVPPFILE*, into a virtual font (OVF) file, *OVFFILE* and its companion font metric (OFM) file, *OFMFILE*.

The program also works with TeX VP files, producing VF and TFM files. (**ovp2ovf** is based on the WEB source code for **vptovf**(1).)

OPTIONS

- help** display a brief summary of syntax and options
- verbose**
 display progress reports
- version**
 output version information and exit

FILES

- OFMFILE*
 Omega Font Metric file
- OVFFILE*
 Omega Virtual Font file
- OVPPFILE*
 Omega Virtual Property List file

BUGS

None known, but report any found to <omega@ens.fr> (mailing list). You should also check to see if the bug is in **vptovf**(1).

AUTHOR

According to the WEB documentation:

VPtoVF is an extended version of the program **PLtoTF**, which is part of the standard TeXware library. **OVP2OVF** is an extended version of **VPtoVF** that allows much larger fonts. The idea of a virtual font was inspired by the work of David R. Fuchs who designed a similar set of conventions in 1984 while developing a device driver for ArborText, Inc. He wrote a somewhat similar program called **PLFONT**.

The primary authors of Omega are John Plaice <plaice@cse.unsw.edu.au> and Yannis Haralambous <yannis@fluxus-virus.com>.

This manual page was written by C.M. Connelly <cmc@debian.org>, for the Debian GNU/Linux system. It may be used by other distributions without contacting the author. Any mistakes or omissions in the manual page are my fault; inquiries about or corrections to this manual page should be directed to me (and not to the primary author).
